Begins With Your Panties!

Women panties are the clothes and personal belongings which are closely related to your health. Do you know what the shelf life of a panty is? What is your understanding towards the level of impurities in a panty? Let us explain the aforementioned below.

Microbiology experts from around the world did a research towards the washing machine and found that the excrement exist in a panty is around 0.1 gram in average. The content of the excrement consists of Salmonella, E. coli and other bacteria, these bacteria cannot be removed entirely regardless of how much we change, wash and dry it every day. When the bacteria and viruses from the excrement are exposed and contaminated the water source, food, cutleries or clothes, these dangerous microorganisms will enter the body and cause harm to the human body.

80% Of Women Diseases Are Closely Related To The Panties!

Usually, you are advised to replace your new panties every 6 months. Using old panties will not only increase the risk of contacting women diseases, it will also cause skin disease, allergies and eczema. It is especially true for the elderly who are only willing to throw away their old panties after it was worn or changes shape due to constant usage. Hence, this is the beginning of women diseases.

The vagina is located between the urethral and the anus, so the bacteria exist in this part will have an easy entry into the vaginal or urinary tract which would cause an infection in the urinary tract or the reproductive system. If the permeability and moisture-absorption power of your panties are of low quality, then it will not be able to stimulate tissue metabolism. A humid environment is suitable for the breeding of trichomoniasis, E.coli and other bacteria. World Health Organization (WHO) warns that around 80% of repeated women diseases are closely related to the panties! Hence, the experts remind every woman to choose high quality panties!

Besides that, choosing the right feminine wash is very important. Soap with added fragrance or feminine wash with chemical formula might affects the pH balance of a vagina which is sensitive as well as removing the good bacteria at the area. **K-LINK International** suggests using the following products to help maintain women personal hygiene:

U-Fresh

It not only helps keep intimate area clean and fresh, it can also help alleviate general menstrual and vaginal discomforts:
